

Kcentra® Dosing Protocol For Emergent Warfarin Reversal:

- Kcentra® should be initiated prior to INR results to aid in rapid administration of therapy
- All patients will receive 10 mg IV Vitamin K with Kcentra®
- All patients will receive an initial fixed dose of 1500 units FIX (3 vials) of Kcentra® for severe life-threatening bleeding due to warfarin therapy
 - Non-life threatening bleeding recommended to be managed with FFP + Vit K
- For the following patients, or at the discretion of the physician, consider increasing empiric dose to 2000 units FIX (4 vials):
 - TBW > 100kg
 - INR > 7.5-10 (if known prior to initiation of therapy)
- For patients who have already received Kcentra® prior to INR results, and the baseline INR returns > 7.5-10, consider an additional 500 units FIX (1 vial) for a total of 2000 units FIX (4 vials)
- Consider ordering a repeat PT/INR 10-60 minutes after Kcentra® infusion
- If repeat INR is > 2, consider additional 500-1000 units FIX (1-2 vials) if patient has not had a positive clinical response to initial therapy

Avoid in patients with DIC, history of HIT, or recent history of thrombosis, MI or ischemic stroke
